

## 4 Advantages of using sketchometry teaching modules

- The content is not presented as a “ready-made system”.
- Independent construction makes students more familiar with the task.
- A self-created construction conveys a sense of achievement.
- “Slowing down” the learning process.
- Intensive engagement with the respective topic.
- Being active.
- Working independently.
- Your own notes force you to think and structure your thoughts.
- Set your own learning pace.
- No previous technical knowledge required.

For organizational reasons alone, it is not possible for teachers to completely change their lessons from one day to the next. The prerequisite for a change of approach is the seamless integration of the new elements into the existing lesson script. The sketchometry teaching modules allow a gradual and low-threshold transition to independent learning with digital media. Individual teaching modules initially replace conventional teaching units. This happens more and more often with increasing experience. Gradually, a collection of teaching modules can be created and then combined into a textbook.
